

THE CONVERSATION EVERYONE'S HAVING — BUT NOT FINISHING

AI won't transform your org. *People will.*

What it actually takes — beyond the tech stack

RALF GEHRIG · GLOBAL CHIEF EXPERIENCE OFFICER · WONGDOODY

Productivity is not the same as *transformation*

Most organisations have individuals using AI to move faster.

The rest of the organisation? Still moving at the same speed.

You get faster silos. Not a faster company.

Closing that gap isn't a technology problem.

It's a trust and engagement problem.

Your *domain experts* feel the stopwatch running

The specialists who've mastered a process over 10, 15, 20 years are being asked to map it out for an agent.

Of course they feel like they're training their replacement.

The reframe that works:

*They're not training a replacement —
they're becoming the steward of it.*

Nothing gets automated once and left. Everything improves iteratively. The person who understands the domain is the most valuable person in the AI's ongoing evolution.

Nobody has the *recipe* yet. Anyone who says otherwise is selling.

Two failure modes we see constantly:

Over-controlled: guardrails so tight the capability becomes unusable.

Under-controlled: 10,000 rogue agents built by individuals — impressive and alarming in equal measure.

The right answer is iterative. Bring legal, security, IT, and business into one room. Make a decision in 30 minutes. Document it. Move.

A slick prototype can quietly become *unworkable*

A client came to us with a vibe-coded prototype and said: build me that.

No backlog. No brief. Just the prototype — which had accumulated features until the experience was overloaded.

What should have been a clean customer journey had become a mess.

Speed of prototyping is real. But without structured design underneath, you're building on sand.

Design the process *first.* Then build.

Run full human-centred design before anyone writes a line of code:

User research → team alignment → priorities → user journeys → AI-assisted mapping → shared board → build environment.

The output is structured. The decisions are traceable.

Everyone from security to privacy to product can see they were consulted and that their inputs shaped the outcome.

That's not just good design. That's what clients need to demonstrate when working with a service provider.
